N-body Simulation

Kirushin I., Anisimov V., Bukhanov B., Peshkov A.

Intro

What is our project about?

Making possible to observe gravitational interaction in complex systems of bodies

Relevance

What's wrong with most gravitational simulators?

Too complex or too simplified

What we suggest

To combine scientific accuracy with user-friendly visualization

Goal

What are we going to implement?

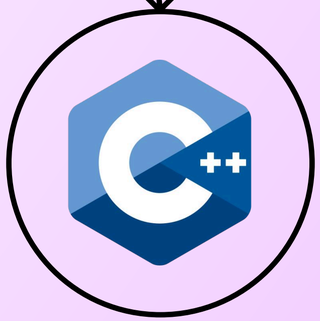
We’re going to implement a gravitational simulator with a graphical interface

What features will it have?

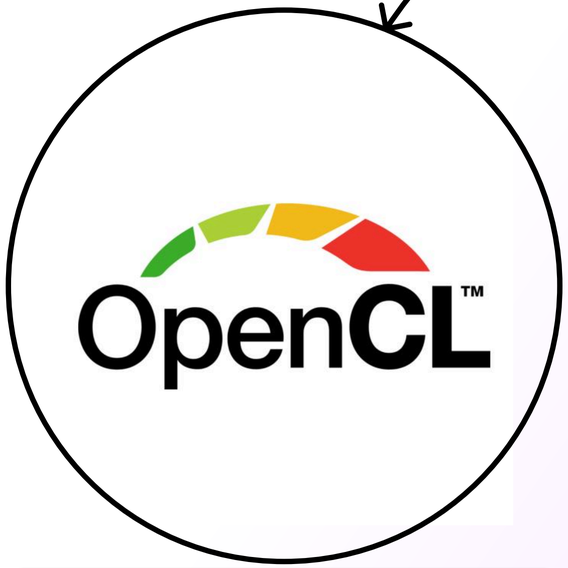
It will allow users to choose the scenery or set custom initial data and observe the gravitational interaction

Tools

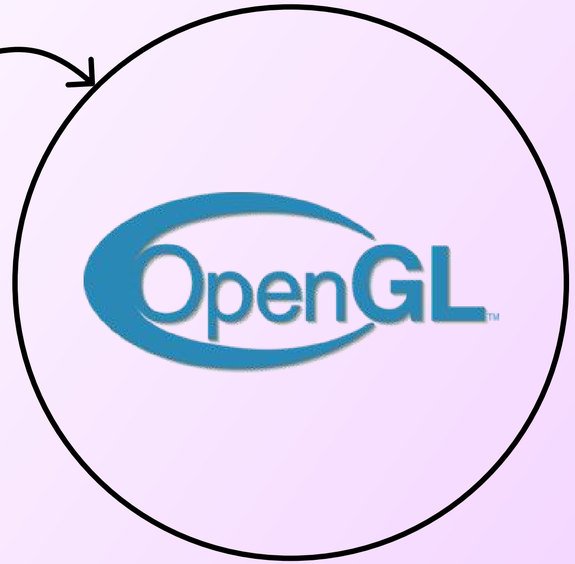
Programming language



Libraries and frameworks for development...



The framework for parallel computations



The library for 3D-graphic

CMake...

Profilers...

Time changing

One of the most useful feature in our program will be the ability to change the time interval between events on a screen

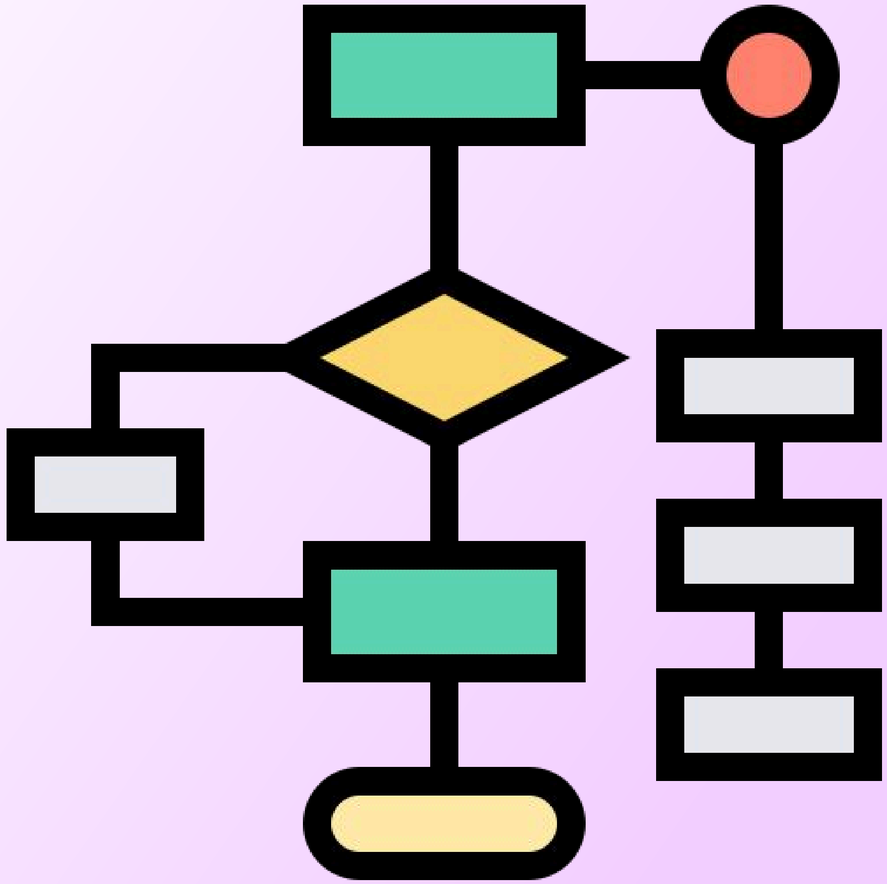
It will allow users to see in more detail what's happening at a specific moment...

Algorithms

The second main idea is to test different calculating algorithms and compare their time of performing and accuracy...

It will allow us to understand what algorithm is the most suitable for our application...

We’re going to use C++ profilers to find out performance on test scenarios...



Parallel computations

The third main task is to implement parallel computations using, for example, OpenCL...

It will allow us to understand what is the maximum amount of objects which interaction we can calculate and show on a screen...
